

KEELLS ONLINE — LOGIN & ONBOARDING UX REDESIGN

Project Overview

This project presents a UX/UI redesign of the Keells Online mobile application, focusing on improving the login and onboarding experience while reducing unnecessary interruptions during the shopping journey.

Redesign Description

The existing Keells Online experience was analysed to identify key usability issues around authentication timing, unclear login context, limited OTP recovery options, and interruptions during the shopping process.

The redesign introduces a **“Shop first, sign in when needed”** approach. Users can enter the shopping experience, browse categories, view products and build their basket without being forced to authenticate at the beginning. Authentication is introduced contextually at checkout, where the purpose of signing in is clearly explained and the basket remains saved.

The redesigned interface also improves visual hierarchy, accessibility, spacing, typography, touch-target usability and system feedback. The OTP experience provides clearer recovery options such as resending the code, changing the mobile number and trying an alternative method.

The solution applies HCI principles including **progressive disclosure, visibility of system status, user control and freedom, error recovery, consistency, and recognition rather than recall**.

Key Improvements

- Contextual authentication at checkout
 - Guest shopping and basket building
 - Clearer checkout and sign-in messaging
 - Improved OTP verification and recovery
 - Modern, accessible and consistent visual design
 - Improved navigation and interaction patterns
